### Introducing StrawNet Pelletized Straw Mulch... it's not your typical straw!

For years straw has been used to help maintain soil moisture during germination. And for years straw being blown-away or washed-out leaving areas of soil exposed has been a problem. Those days are over with the introduction of StrawNet, the Pelletized Straw Mulch. It's simple.

Compressed straw fibers are formed into easily applied pellets that weigh

**Holding moisture around the seed during germination process is one of the major keys to successful seeding**

more than conventional straw so they can't be blown around. Add water and the pellets swell and rupture forming a thin but dense ground cover. Special binding agents have been added during production to help the straw fibers net

together with themselves and the soil creating a moisture trapping layer of straw fiber. This layer will provide a barrier from wind and evaporation while allowing water to infiltrate for ideal seed germination. StrawNet... all the performance of straw in an easy to apply, easy to store pellet. For more information contact a distributor near you or visit [www.StrawNet.com](http://www.StrawNet.com)

**Just applied StrawNet with no irrigation or rain -still in pellet form.**

**After light rain or irrigation - partially ruptured pellets.**

**After several rains or irrigations - completely ruptured pellets.**

PELLETIZED STRAW MULCH

# Everything Straw does and a whole lot more

## Ease of Application

Being in the pelletized form, StrawNet can be applied easily in any number of ways. For small spot repairs StrawNet can be applied directly by hand with no mess. For seeding projects of a few thousand feet or more, a walk behind mulch spreader should do the trick. And for those larger projects involving a few acres, we suggest using a three-point hitch spreader.

## Prevents Blow-Off

Because StrawNet has eight times greater bulk density than conventional straw the blowing problems related to straw are completely eliminated. Additionally, special binding agents have been added to StrawNet to actually net the straw fibers together. This netting effect not only bonds the straw with itself but with the soil surface below forming a moisture absorbing barrier between the soil and environment.

## Captures Moisture

Unlike conventional straw, StrawNet can hold up to four times its weight in moisture. This ability to hold moisture helps increase water infiltration and reduce water run-off. The ability to maintain this moisture at the surface where the seed resides during germination is the key to successful seed establishment. This ability to trap and hold moisture can improve any seeding project's success.

## Weed-Free Product

The pelletizing process of StrawNet involves high temperatures that kill undesirable seeds that may be mixed in conventional straw.

## Available in:

- 50 lb. bags
- 40 bags per pallet
- 2,000 lb. totes for large projects

## Application Rate:

- 100 lbs. per 1,000 square feet

## Applications:

- Turf grass
- Wildflowers
- Native grasses
- Gardens

## Distributed by:

**Manufactured by:**  
Pelletized Straw, L.L.C.

**PATENT PENDING**
